

mydocma platform - holistic digitalisation of construction projects

Simplifying complex construction processes, creating transparency and promoting collaborative working - these are the strands that the Munich-based IT company edr software brings together on the mydocma platform. Designed as a central workspace, it serves as a digital control centre and source of information for construction processes - throughout the entire life cycle. It offers modular construction software, including for the documentation and management of defects, images, construction processes, fire protection measures, formulas, documents, etc. - and includes all resources for project work: user authorisations, project and company data, organisational and property structures, BIM models, plans and statistical evaluations. The software solutions are operated via intuitive web clients that follow progressive trends, for example by enabling the application of the BIM method, the use of robotics with 360-degree images and integrated data management across different systems via interface technology. The software manufacturer, which has over two decades of industry experience, has developed numerous components for process optimisation and tested them in practice - rights and role system, workflow automation, web link for integrating subcontractors, deadline system, standard documents, reports and much more.
